

P350 Series Stainless & Aluminum Filters

The P350 series filters are high pressure units usually not for use directly on the pilot, but rather utilized on the tap out from a high pressure line. The sooner the medium is cleaned before moving toward the pilot operation, the less chance of debris and moisture clogging input lines and filters upstream of the high pressure supply.

The maximum inlet pressure for the Stainless version is 5,000 PSIG while the Aluminum version is 2,150 PSIG.

The P350 filter can be found in Tab 5.
